

NEWS RELEASE

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, THURSDAY, MARCH 27, 2008

Virginia H. Mannering: (202) 606-5304 (GDP) BEA 08-12

Andrew Hodge: (202) 606-5564 (Profits)

Recorded message: (202) 606-5306

GROSS DOMESTIC PRODUCT: FOURTH QUARTER 2007 (FINAL) CORPORATE PROFITS: FOURTH QUARTER 2007

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- increased at an annual rate of 0.6 percent in the fourth quarter of 2007, according to final estimates released by the Bureau of Economic Analysis. In the third quarter, real GDP increased 4.9 percent.

The GDP estimates released today are based on more complete source data than were available for the preliminary estimates issued last month. In the preliminary estimates, the increase in real GDP was also 0.6 percent (see "Revisions" on page 3).

The increase in real GDP in the fourth quarter primarily reflected positive contributions from personal consumption expenditures (PCE), exports, nonresidential structures, state and local government spending, and equipment and software that were largely offset by negative contributions from private inventory investment and residential fixed investment. Imports, which are a subtraction in the calculation of GDP, decreased.

The deceleration in real GDP growth in the fourth quarter primarily reflected a downturn in inventory investment and decelerations in exports, in federal government spending, and in PCE that were partly offset by a downturn in imports.

Final sales of computers contributed 0.16 percentage point to the fourth-quarter growth in real GDP after contributing 0.28 percentage point to the third-quarter growth. Motor vehicle output subtracted 0.86 percentage point from the fourth-quarter growth in real GDP after contributing 0.36 percentage point to the third-quarter growth.

NOTE.--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and are annualized. "Real" estimates are in chained (2000) dollars. Price indexes are chain-type measures.

This news release is available on <u>BEA's Web site</u> along with the <u>Technical Note</u> and <u>Highlights</u> related to this release.

- 2 -

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 3.7 percent in the fourth quarter, 0.2 percentage point less than the preliminary estimate; this index increased 1.8 percent in the third quarter. Excluding food and energy prices, the price index for gross domestic purchases increased 2.3 percent in the fourth quarter, compared with an increase of 1.9 percent in the third.

<u>Real personal consumption expenditures</u> increased 2.3 percent in the fourth quarter, compared with an increase of 2.8 percent in the third. <u>Real nonresidential fixed investment</u> increased 6.0 percent, compared with an increase of 9.3 percent. Nonresidential structures increased 12.4 percent, compared with an increase of 16.4 percent. Equipment and software increased 3.1 percent, compared with an increase of 6.2 percent. <u>Real residential fixed investment</u> decreased 25.2 percent, compared with a decrease of 20.5 percent.

<u>Real exports of goods and services</u> increased 6.5 percent in the fourth quarter, compared with an increase of 19.1 percent in the third. <u>Real imports of goods and services</u> decreased 1.4 percent, in contrast to an increase of 4.4 percent.

<u>Real federal government consumption expenditures and gross investment</u> increased 0.5 percent in the fourth quarter, compared with an increase of 7.1 percent in the third. National defense decreased 0.5 percent, in contrast to an increase of 10.1 percent. Nondefense increased 2.8 percent, compared with an increase of 1.1 percent. <u>Real state and local government consumption expenditures and gross</u> investment increased 2.8 percent, compared with an increase of 1.9 percent.

The <u>real change in private inventories</u> subtracted 1.79 percentage points from the fourth-quarter change in real GDP, after adding 0.89 percentage point to the third-quarter change. Private businesses decreased inventories \$18.3 billion in the fourth quarter, following increases of \$30.6 billion in the third quarter and \$5.8 billion in the second.

<u>Real final sales of domestic product</u> -- GDP less change in private inventories -- increased 2.4 percent in the fourth quarter, compared with an increase of 4.0 percent in the third.

Gross domestic purchases

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- decreased 0.4 percent in the fourth quarter, in contrast to an increase of 3.3 percent in the third.

Gross national product

Real gross national product -- the goods and services produced by the labor and property supplied by U.S. residents -- increased 1.9 percent in the fourth quarter, compared with an increase of 5.8 percent in the third. GNP includes, and GDP excludes, net receipts of income from the rest of the world, which increased \$37.6 billion in the fourth quarter after increasing \$25.9 billion in the third; in the fourth quarter, receipts decreased \$12.9 billion, and payments decreased \$50.5 billion.

- more -

- 3 -

Current-dollar GDP

Current-dollar GDP -- the market value of the nation's output of goods and services -- increased 3.0 percent, or \$103.7 billion, in the fourth quarter to a level of \$14,074.2 billion. In the third quarter, current-dollar GDP increased 6.0 percent, or \$201.7 billion.

Revisions

The final estimate of the fourth-quarter increase in real GDP is the same as the preliminary estimate issued last month, primarily reflecting a downward revision to inventory investment and smaller downward revisions to several other GDP components that were largely offset by upward revisions to personal consumption expenditures and to exports.

	Advance	Preliminary	<u>Final</u>
	(Percent chang	e from preceding	g quarter)
Real GDP	0.6	0.6	0.6
Current-dollar GDP	3.2	3.3	3.0
Gross domestic purchases price index	3.8	3.9	3.7

Corporate Profits

Profits from current production (corporate profits with inventory valuation and capital consumption adjustments) decreased \$52.9 billion in the fourth quarter, compared with a decrease of \$20.5 billion in the third quarter. The fourth-quarter profits estimates reflect large adjustments that raised profits in the national income and product accounts (NIPAs) relative to profits as reported in corporate financial source data in order to account for differences in the treatment of asset write-downs and loan-loss provisions, which are not expensed in current-production profits in the NIPAs (see Technical Note).

Current-production cash flow (net cash flow with inventory valuation and capital consumption adjustments) -- the internal funds available to corporations for investment -- decreased \$55.7 billion in the fourth guarter, compared with a decrease of \$21.1 billion in the third.

Taxes on corporate income decreased \$15.0 billion in the fourth quarter, compared with a decrease of \$20.7 billion in the third. Profits after tax with inventory valuation and capital consumption adjustments decreased \$37.9 billion in the fourth quarter, in contrast to an increase of \$0.3 billion in the third. Dividends increased \$21.7 billion, compared with an increase of \$23.5 billion; current-production undistributed profits decreased \$59.5 billion, compared with a decrease of \$23.3 billion.

- more -

- 4 -

Domestic profits of financial corporations decreased \$74.4 billion in the fourth quarter, compared with a decrease of \$32.5 billion in the third. Domestic profits of nonfinancial corporations decreased \$34.3 billion in the fourth quarter, compared with a decrease of \$14.4 billion in the third. In the fourth quarter, real gross value added of nonfinancial corporations increased, and profits per unit of real product decreased. The decrease in unit profits reflected increases in both the unit labor and nonlabor costs corporations incurred that were partly offset by an increase in unit prices.

The rest-of-the-world component of profits increased \$55.8 billion in the fourth quarter, compared with an increase of \$26.4 billion in the third. This measure is calculated as (1) receipts by U.S. residents of earnings from their foreign affiliates plus dividends received by U.S. residents from unaffiliated foreign corporations minus (2) payments by U.S. affiliates of earnings to their foreign parents plus dividends paid by U.S. corporations to unaffiliated foreign residents. The fourth-quarter increase was accounted for by an increase in receipts and a decrease in payments.

Profits before tax with inventory valuation adjustment is the best available measure of industry profits because estimates of the capital consumption adjustment by industry do not exist. This measure reflects depreciation-accounting practices used for federal income tax returns. According to this measure, domestic profits of financial and nonfinancial corporations decreased in the fourth quarter. The decrease in nonfinancial corporations reflected decreases in wholesale trade, in manufacturing, and in transportation and warehousing that were partly offset by increases in information and in utilities. Within manufacturing, the decrease was more than accounted for by petroleum.

Profits before tax increased \$0.2 billion in the fourth quarter, in contrast to a decrease of \$51.8 billion in the third. The before-tax measure of profits does not reflect, as does profits from current production, the capital consumption and inventory valuation adjustments. These adjustments convert depreciation of fixed assets and inventory withdrawals reported on a tax-return, historical-cost basis to the current-cost measures used in the national income and product accounts. The capital consumption adjustment decreased \$4.1 billion in the fourth quarter (from -\$237.4 billion to -\$241.5 billion), compared with a decrease of \$3.0 billion in the third. The inventory valuation adjustment decreased \$49.1 billion (from -\$20.3 billion to -\$69.4 billion), in contrast to an increase of \$34.4 billion.

Effective with this release, chained-dollar gross value added of nonfinancial corporate business was revised beginning with 2004. The current-dollar gross value added is deflated by a revised chain-type price index calculated using the gross value added chain-type index for nonfinancial industries from the annual revision of the GDP-by-industry accounts that were released in January 2008.

Corporate profits in 2007

Profits from current production increased 2.7 percent in 2007, compared with an increase of 13.2 percent in 2006. Domestic profits decreased 3.0 percent, in contrast to an increase of 12.3 percent. The rest-of-the-world component of profits increased 31.2 percent, compared with an increase of 17.9 percent.

Taxes on corporate income increased 2.8 percent in 2007, compared with an increase of 15.5 percent in 2006. Profits after tax with inventory valuation and capital consumption adjustments increased 2.6 percent, compared with an increase of 12.2 percent. Dividends increased 13.8 percent, compared with an increase of 16.2 percent; current-production undistributed profits decreased 16.8 percent, in contrast to an increase of 5.9 percent.

- 5 -

According to the measure of profits before tax with inventory valuation adjustment, domestic profits of financial and nonfinancial corporations decreased in 2007. The decrease in nonfinancial corporations reflected a decrease in "other" nonfinancial that was partly offset by increases in information, in retail trade, in manufacturing, in utilities, in transportation and warehousing, and in wholesale trade. Within manufacturing, increases in most industries shown were partly offset by a decrease in petroleum.

r Revised

NOTE.—Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.

See "Explanatory Note" at the end of the tables.

r Revised See "Explanatory Note" at the end of the tables.

r Revised

1. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions. Percentage changes for these series are included in the addenda to table 8 and in appendix table A.

See "Explanatory Note" at the end of the tables.

r Revised

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments, current surplus of government enterprises, and wage accruals less disbursements, plus personal income receipts on assets, and personal current transfer receipts.

2. Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.

r Revised. Revisions include changes to series affected by the incorporation of revised wage and salary estimates for the third quarter of 2007.

1. The current-dollar gross value added is deflated using the gross value added chain-type price index for non-financial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of

the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross value added and the consumption of fixed capital.

4. The deflator for gross value added of nonfinancial corporate business divided by 100.

NOTE.—Estimates in this table are based on the 1997 North American Industry Classification System (NAICS).

r Revised

1. Some components of final sales of computers include computer parts.

2. Farm output less intermediate goods and services purchased.

3. Consists of GDP less gross value added of farm, of households and institutions, and of general government.

^{4.} This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions. See "Explanatory Note" at the end of the tables.

Explanatory Note: NIPA Measures of Quantities and Prices

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year -- at present, the year 2000 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2005-06 annual percent change in real GDP uses prices for 2005 and 2006 as weights, and the 2005-06 annual percent change in GDP prices uses quantities for 2005 and 2006 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, 8, and Appendix Table A. Contributions by major components to changes in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2000) dollar estimates." For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be $$110 (= $100 \times 110 / 100)$. Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
